The value of urban natural environments is widely acknowledged, and supported by a growing body of evidence, and many examples of good practice, and yet there is still a gap between what we know, and what we do in practice, across the environment, health and social care sectors. The aim of this seminar series is to move the agenda on to consider how we might adopt a more structural, systemic and landscape approach to utilising the health and wellbeing benefits of natural environments at a city wide level. The presentations will address a range of issues such as:

- Relevance of historical precedent
- Systemic barriers to green health (policy, governance, siloing, budgets, conceptual)
- What kinds of evidence do we need to overcome these barriers?
- Anatomy of a healthy city
- Examples of best practice
- The limits of a green health approach (who or what are not susceptible to such an approach)
