Problem

Facial animation is difficult to do convincingly, particularly when synchronizing with speech. There are various ways to automate facial animation:

- Performance-driven animation
- Audio-driven animation
- Audio-visual text-to-speech synthesis (AVTTS)

The problem with these solutions is they bring together software and data formats from different fields—in particular speech technology and graphics technology—that are not well integrated.

Solution

Software framework called “Carnival” which places speech and graphics components within a single object-oriented system.

- Fast and automatic end-to-end processing
- Real-time animation and linked display of time-varying representations for instantaneous feedback/feed-forward information
- Standardized object interfaces for easy integration of new components

The core of our solution is a platform independent C++ API.

Applications

- API may be used for fast prototyping of automated animation systems
- Suitable for performance-driven, audio-driven, or AVTTS applications
- Our implemented tool built on the API is suitable for in-house industrial or academic use
