Demanding an Explanation: Implicit Causality Biases in Discourse Interpretation

Hannah Rohde & Andrew Kehler

Abstract

Problem: Previous passage-completion studies report strong biases regarding who will be mentioned next following implicit causality (IC) verbs with a 'because' prompt. However, these biases are reduced/eliminated with a full-stop prompt.

Results: By categorizing responses by coherence relation, we localize the previously reported IC bias to Explanation relations. We find an additional IC bias concerning P(Explanation).

Materials: 40 IC verbs (20 IC-1, 20 IC-2) and 40 Non-IC verbs

Evaluation: judges annotated for next mention & coherence relation

1. Goal

To clarify the effects of IC biases on discourse interpretation by distinguishing (i) next mention biases and (ii) biases toward upcoming coherence relations.

2. Previous work on Implicit Causality

Passage completions: strong IC bias to particular referent with 'because' prompt (Caramazza, Grober, Garvey, Yates 1974; McKoon, Greene, Ratcliff 1993; inter alia)

1. a. IC-1 John annoyed Mary because __________ [bias to NP1-John]
   b. IC-2 John scolded Mary because __________ [bias to NP2-Mary]
   c. Non-IC John babysat Mary because __________ [mixed biases]

However, next-mention bias reduced/eliminated with full-stop prompt (Au 1986, inter alia)

2. a. IC-1 John annoyed Mary __________ [bias to NP1-John]
   b. IC-2 John scolded Mary __________ [bias to NP2-Mary]
   c. Non-IC John babysat Mary. __________ [mixed biases]

What is role of 'because'?

• Modifying salience of event participants directly (Stevenson, Knott, Oberlander, & McDonald 2000)
• Signaling an Explanation coherence relation (Hobbs 1979, Kehler 2002)

3. Using coherence to mode next-mention biases

We generalize Rohde, Kehler, & Elman’s (2007) pronoun model to next mention: Biases towards upcoming coherence relations (CRs) combine with biases for which event participant will be mentioned again, conditioned on coherence

3. P(next_mention = referent) = Σ P(CR)*P(next_mention = referent|CR)

4. Story continuation experiment

2 x 3 design: verb type (IC vs. Non-IC) x continuation type (full stop vs. because vs. dialog prompt – dialog results not discussed here)

Task: construct natural continuation to context sentence and prompt

Materials: 40 IC verbs (20 IC-1, 20 IC-2) and 40 Non-IC verbs

Evaluation: judges annotated for next mention & coherence relation

6. IC-1 Results

Next-mention biases were statistically indistinguishable when only 'because' prompts and freely generated Explanations were considered (F(1,70)=0.4424, p=0.8822; F(1,19)=0.032, p=0.86)

Again, next-mention biases statistically indistinguishable when only Explanations are considered 'because' or freely generated (F(1,61)=1, p=0.5081; F(1,36)=1.4598, p=0.2348)

5. Non-IC Results

IC verbs create an expectation regarding the direction the discourse is likely to take – specifically a bias towards an upcoming Explanation

Findings for full-stop prompt: IC verbs yield more Explanation continuations than do Non-IC verbs

6. A new IC bias

IC verbs create an expectation regarding the direction the discourse is likely to take – specifically a bias towards an upcoming Explanation

7. IC-2 Results

Again, next-mention biases statistically indistinguishable when only Explanations are considered 'because' or freely generated (F(1,73)=0.4424, p=0.8822; F(1,19)=1.2235, p=0.2825)

Like Rohde et al.’s results, overall statistics conceal a consistent system of stronger biases once coherence relations are conditioned on.

In contrast to previous results:

• Connective alone does not affect referent salience – mediated by coherence
• There are actually two strong biases that differentiate IC and Non-IC verbs: P(CR = Explanation) is high for IC-1 and IC-2 P(next_mention = NP1 | Explanation) is high for IC-1 and low for IC-2

The presence of a second bias had gone unnoticed because previous studies had not categorized their data by coherence.

8. Conclusions

Like Rohde et al.’s results, overall statistics conceal a consistent system of stronger biases once coherence relations are conditioned on.

In contrast to previous results:

• Connective alone does not affect referent salience – mediated by coherence
• There are actually two strong biases that differentiate IC and Non-IC verbs: P(CR = Explanation) is high for IC-1 and IC-2

P(next_mention = NP1 | Explanation) is high for IC-1 and low for IC-2

The presence of a second bias had gone unnoticed because previous studies had not categorized their data by coherence.
